

ROELOF's 1K+ NON DIRECTIONAL BEACON OFFSETS

This list is an update of ROELOF's 1K NON DIRECTIONAL BEACON OFFSETS which was published in December 2005. The list contains the offsets of 1136 NDB's received in Middelburg in the south-western part of the Netherlands, locator JO11tm. More than 800 stations have been received in October, November and December 2006. Many more stations show now both offsets, were previously just one could be established.

The list has been made out off necessity: using very narrow filters, it can be rather cumbersome to find a particular station without knowing the accurate offset. Offsets were measured using aural reception. The main tool was a Wandel & Goltermann SPM-30 selective level meter in conjunction with a home made add-on unit. The latter contains a pitch shifter to convert the 2000 Hz beat note from the SPM-30 to 500 Hz. Two cascaded audio filters, 12 and 6 Hz wide, complement the reception setup. Also a number of stations were logged with an ICOM R75 receiver, followed by the 12 and 6 Hz audio filters.

The offsets are accurate to +/- 2 Hz at the time of measurements. Many beacons do drift, though often less than 10 Hz. It has been observed that many stations had drifted in summer, but are now back on the old frequency measured in the winter of 2005 / 2006.

ROELOF's 1K+ NON DIRECTIONAL BEACON OFFSETS is a tool to help find some of the NDB's that are out there.

I hope you have some use for it.

Best regards,
Roelof Bakker, pa0rtd
